Skills

Systems & Backend

Rust, WebAssembly, Go, Node.js,
Python, SQL, gRPC, OpenAPI

Infrastructure & Cloud

Linux, Docker, Containers, Edge
Computing, On-Premises

Web Technologies

TypeScript, React, CSS, Web
Security

Mobile / Native

React Native, Tauri, PWAs

Languages

German

English
C2 Proficiency

Software engineer focused on Rust, WebAssembly, and backend systems. I build reliable, high-throughput services and backend infrastructure, with experience across TypeScript, web security, developer tooling, and self-hosted platforms. Outside of work, I build open-source developer tools, privacy-focused software, and systems software.

Experience

AnyDesk Software GmbH Stuttgart
Backend Engineer Feb 2025 - Present

I develop and maintain core backend services used by AnyDesk clients, supporting a platform with hundreds of millions of sessions per month. My work focuses on high-throughput systems, reliability, performance, and operational correctness.

Self-employed Berlin
Freelance Software Engineer September 2021 - 2024

I worked with clients across different industries, delivering web and mobile applications, backend services, and custom technical solutions. This strengthened my ability to understand requirements quickly, work independently, and ship reliable software across varied technology stacks.

canX GmbH July 2017 - 2020
Co-Founder

I co-founded canX, a multimedia streaming and social platform, where I worked across React Native/Next.js applications, backend services, a custom video player, and CDN-related infrastructure. I also helped shape product direction and technical architecture in a small startup team.

Projects

TinyWasm November 2023 - Present
Open-source WebAssembly runtime written in Rust, with 500+ GitHub stars. Designed for portability, safe execution, and minimal dependencies, with support for constrained environments and an internal bytecode format for efficient execution.
<https://github.com/explodingcamera/tinywasm>

liwan.dev Summer 2024 - Present
Open-source, privacy-focused web analytics platform written in Rust. Designed for self-hosted deployment with a single binary, low operational overhead, embedded storage, and privacy-preserving analytics without cookies, cross-site tracking, or persistent identifiers.
